**Law Manager Data Quality Tracker**

**April 2026**

*Executive Summary*

Since the creation of the Data Quality Coordinator Team, Law Manager data has notably improved.

- The backlog of **missing court date errors** has declined from 9,469 to 475, a 95% decrease in errors.
- Missing **current top charge errors** have declined from nearly 1,200 to 468 per week on average.
- There have been a total of **12,506 errors corrected** as of April 2026.
    - 5,988 Case Appearance Corrections, corresponding to missing court dates and case resolution changes
    - 5,923 Matter Corrections which corresponds to changes to the current top charges and noting consolidation of indicted cases.
    - 595 Initial Top Charge Corrections

**Introduction**

The Data Quality Coordinators' progress in reducing systemic data errors in Law Manager has been successful. In order to organize and track this progress, a SQL query has been developed to track errors and updates made specifically by the team's members. This is to ensure the workflow stays constant and priority items that affect attorney cases or attorney case management dashboards are maintained.

The report aims to track corrections to the matter table, case appearances, and charge tables. These edits should correspond to error corrections for: case status updates, court dates, appearance updates, and initial top charges. The process is semi-automatic, where two scripts are run to extract the data and summarize the case counts.

As of April 2026, the Data Quality Coordinators make 1,700 error corrections a month, primarily to court dates, case statuses, and top charges, on 29,000 active cases with 50,000 new or updated case appearances from the UCE feed. This suggests a systematic error rate of around 3.5%.

## Methodology

A SQL script is used to extract the data using the individual user ID in the *updated_by* or *added_by* fields in Law Manager. This represents a snapshot of all user updates to Matter, Case Appearance, and Initial Top Charge, tables. Error snapshots are compiled in a similar manner to create a historical error backlog.

New updates by users outside of the Data Coordinators will overwrite the values in *updated_by* fields, resulting in an actual undercount of error corrections made by the team. To address this, regular snapshots are taken once every two weeks to once a month, to balance reporting needs and staff time.

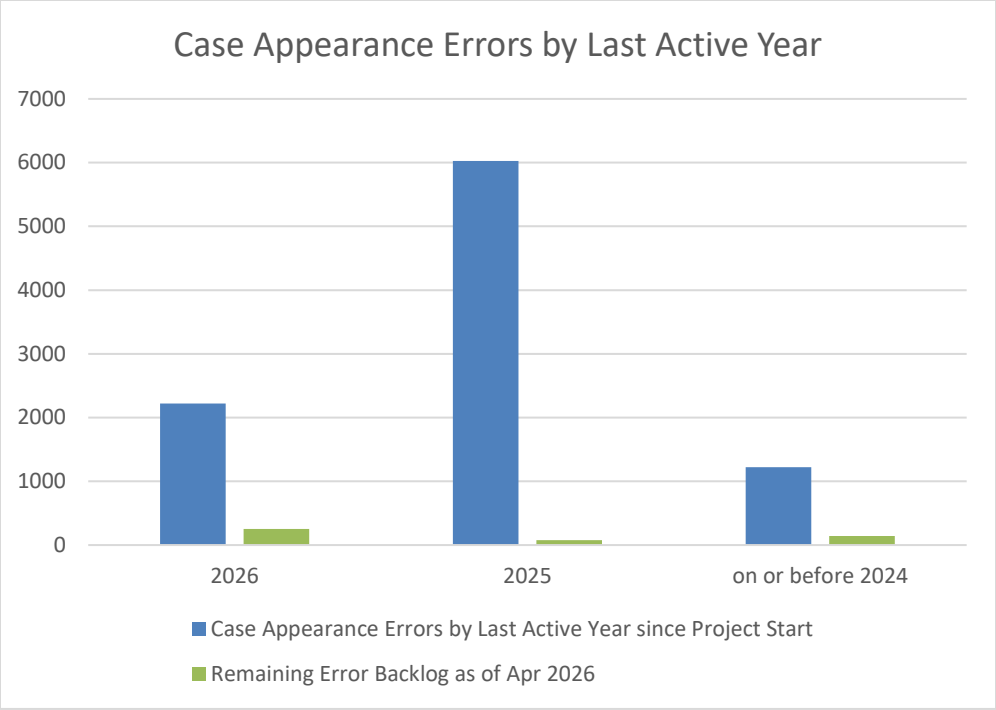
After the data is extracted, a Python script concatenates an archive of all the snapshot data from SQL, creating historical data. In Python, the data is further processed using standardized dates which are formatted into a pivot table automatically. This is a reasonably accurate way to account for the Data Quality team's progress.

## Data Error and Corrections Analysis

*Missing Next Court Date Error Backlog*

Since project inception in June 2025, Law Manager housed a backlog of cases, some dating back to 1988, that required correction to the next court date or closure. Most of the errors were last active in 2025, with 6,025 unresolved cases and 76 remaining to be resolved. Of the 1,224 cases that are even older, only 144 cases are remaining to be resolved. Fixing these errors contributes to better overall data quality and to attorney case management.

Note that some of the errors may no longer exist in NYCIS and the information about the cases are lost and might not have a resolution that can be validated. Many errors may also be resolved by the UCE feed.

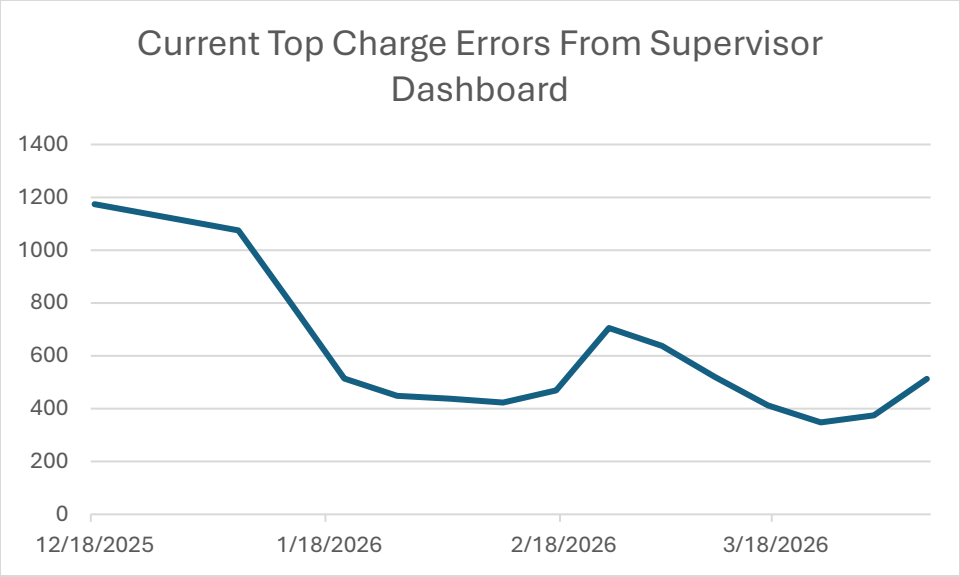


| Last Active Year | Missing Court Date Errors Since Project Start | Remaining Error Backlog as of April 2026 |
|---|---|---|
| 2026 | 2220 | 255 |
| 2025 | 6025 | 76 |
| on or before 2024 | 1224 | 144 |
| **Grand Total** | **9469** | **475** |

*Missing Current Top Charge Errors*

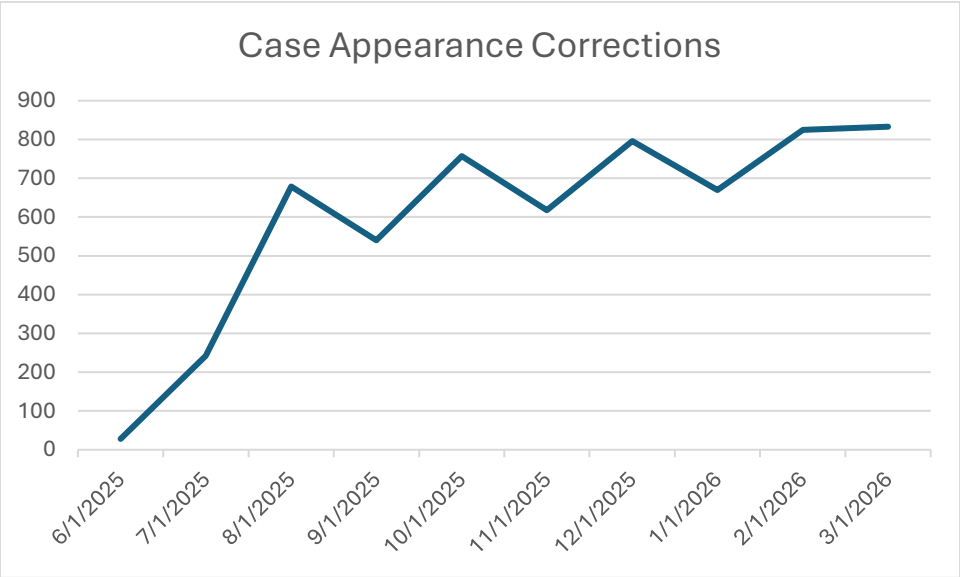
Since the development of the Attorney Supervisor Dashboard, priority was given to correcting missing current to charge errors. These charges feed into a scoring rubric for supervising attorneys to manage caseloads.

New errors accumulate every day, and the Data Quality team clears them on a weekly basis. At the inception of the dashboard, nearly 1,200 cases were missing. As of April 2026, there are 468 errors on average per week.

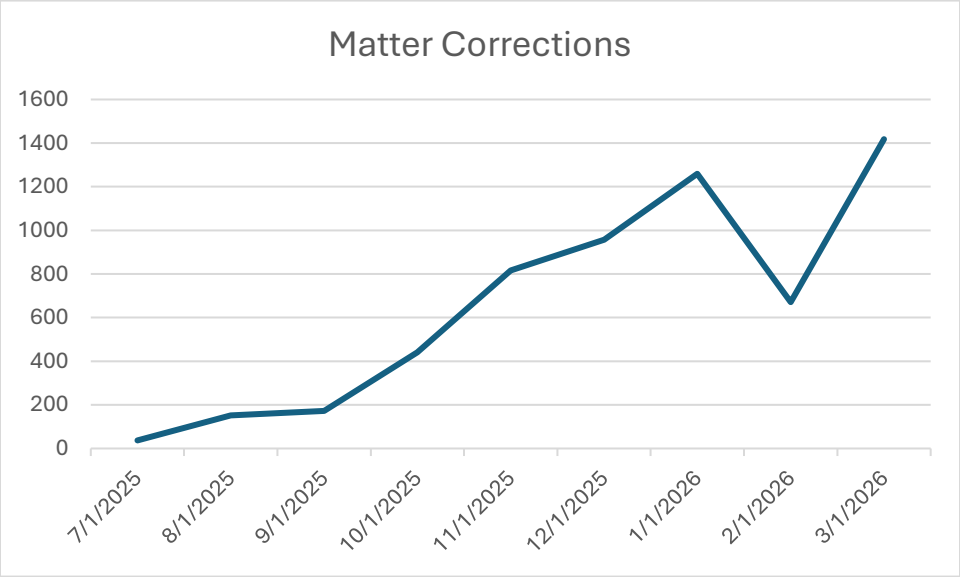


*Case Corrections*

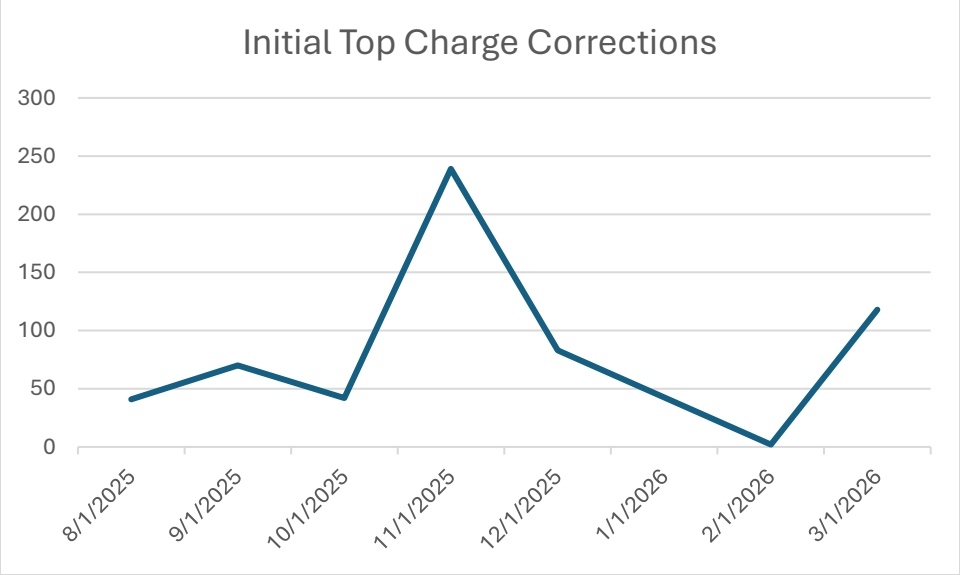
The **case appearance corrections** correspond to missing court dates, case disposition closures, conflict assignments, and first appearance validations. These updates are generally associated with the quality of digital case files. Since June 2025 through March 2026, an estimated total of 5,988 corrections to case appearances. Over the last six months, an average of 749 cases have been corrected by the Data Coordinator team.



The **matter corrections** correspond to updates to the current top charge, and notations for case consolidations. The current top charge corrections feed directly into Supervising Attorney dashboards, which use charge types in weighing attorney case load. Since July 2025 there were 5,923 corrections to case matters, and an average of 927 corrections over the past six months.



Corrections to the **initial top charges**, via the charge table, tracks additions made to the initial top charges. These correspond to charges found on the criminal complaint, which can sometimes be missing from the case entry. This project is less of a priority. So far, since August 2025, there have been 595 corrections.



**Future Considerations**:

As certain project enter the team's workflow, new SQL queries would need to be made to track those snapshots as well. And more of the report is expected to be automated going forward. Power BI integration is also possible. Integration into Power BI is also possible.

With this report, we can track data inflows and outflows and respond to the needs of Legal Aid efficiently. The stock of past errors is expected to wind down, and the team's focus would be directed to incoming errors or to help with other tasks such relating to Salesforce data migration.
